PROBLEM TO BE SOLVED: To obtain tetrafluoro-[2,2]-paracyclophane high in heat resistance in the presence of oxygen, and useful for a raw material for forming a coating membrane expected to have a good balance in all physical properties by a chemical vapor depositing method. **SOLUTION:** This compound, tetrafluoro-[2,2]-paracyclophane expressed by formula I is obtained by reacting [2,2]-paracyclophane in an inert solvent in the presence of a peroxide catalyst, in an ultraviolet irradiation or in both, with a brominating agent such as N-bromosuccinimide to obtain tetrabromo-[2,2]-paracyclophane, then treating it with sodium acetate, silver acetate, etc., in an acetic acid solution to obtain diketone-[2,2]-paracyclophane expressed by formula II, and further treating the compound of the formula II with a fluorinating agent such as tetrafluorosulfur or diethylaminosulfurtrifluoride.
